Step-by-Step Guide to Wiring the MS OPS5M Sensor

Getting familiar with the wiring diagram is one thing, but executing the wiring safely and correctly is where many installers need guidance. Here's a straightforward approach to wiring your Lutron MS OPS5M sensor:

1. Turn Off Power at the Circuit Breaker

Safety first. Never start electrical work without cutting power to the circuit. This prevents shocks and protects your devices.

2. Identify Wires in Your Electrical Box

Use a voltage tester to confirm the line (hot) wire, neutral, and ground wires. Label them if necessary. Having the correct identification will make wiring easier and safer.

3. Connect the Black Wire (Line) from the MS OPS5M to the Hot Wire

Match the black sensor wire to the hot wire in your electrical box. Use a wire nut to secure the connection firmly.

4. Connect the White Wire (Neutral) from the Sensor to the Neutral Wire

The white wire is crucial for completing the circuit and allowing the sensor's electronics to function.

5. Connect the Red Wire (Load) to the Lighting Fixture

This wire controls the light. It should be connected to the wire leading to your lighting fixture or load.

6. Attach the Ground Wire

Connect the green or bare copper ground wire from the sensor to the grounding wire in the box. This step is essential for safety and compliance with electrical codes.

7. Secure All Connections and Mount the Sensor

After confirming all wires are correctly connected, tuck them neatly into the box, secure the sensor with mounting screws, and attach the faceplate.

8. Restore Power and Test the Sensor

Turn on the circuit breaker and test the sensor by moving within its detection range. Adjust sensitivity or time delay settings if necessary.

Common Wiring Challenges and How to Troubleshoot

Even with a clear wiring diagram, installers sometimes face issues with the Lutron MS OPS5M sensor. Understanding common problems can save time and frustration.

- **Sensor Not Turning Lights On:** This usually points to incorrect wiring of the load or line wires. Double-check connections, especially the red (load) and black (line) wires.
- **Lights Flickering or Turning Off Unexpectedly:** Loose connections or insufficient neutral wiring can cause erratic behavior. Ensure all wire nuts are tight and the

neutral wire is properly connected.

- **Sensor Always On or Off:** Sensitivity settings may need adjustment, or the sensor might be installed in a location with limited infrared detection. Review installation placement and settings.
- **No Power to Sensor:** Confirm the circuit breaker is on and the wiring matches the diagram, paying special attention to the hot (line) wire.

If problems persist, consulting the Lutron technical support or a licensed electrician is recommended.
